SCOPE

bkm in partnership with CW Driver, bkm installed 82k ft of raised access floor at the new Soboba Casino Resort, in Hemet CA.

This Casino, like most, has very high ceilings and thousands of gaming machines, tables and promotional displays spread throughout the casino floor. These items need to be easily reconfigured with access to electrical and data without messy and disruptive construction. There was also the requirement to have the HVAC routed through the floor.

ABOUT THE PRODUCT

To achieve these requirements bkm installed a ASM concrete filled steel panel with 18" pedestals, grommets and air diffusers to route the HVAC. When the HVAC is routed through the floor, the building uses less energy than forcing the cool air down from the overhead ductwork system. This also keeps the ceiling free of mechanical equipment.

In addition to the cost savings from routing HVAC under the floor, there are additional savings when placing and relocating gaming equipment. With a concrete floor, new locations would require trenching. Sawing the floor not only takes a lot of time, it is costly, and dust can damage gaming equipment electronics. With ASM access flooring, power and data can be easily relocated by removing a few access floor panels and rerouting cables.

INSTALLATION PROGRESS PHOTOS

bkm self performed the installation over the course of 6 weeks. There were multiple changes made in the field, but due to the nature of the product, bkm was able to make those changes without affecting the schedule.
